

VMEC/Boozer aggregate alpha-heldout gate: passed

Split objective

Generalization check

Claim boundary

status: passed
objective: quasilinear_flux
final delta: -1×10^{-8}
training passed: True
heldout passed: True
train rel.: 0.00220170083056736
heldout rel.: $6.770148522620082 \times 10^{-5}$
wall seconds: 25.69

The accepted QH coefficient update is trained on $\alpha=0$ and evaluated on a held-out $\alpha=0.5$ with the same ky samples. This is a reduced linear/quasilinear split gate, not a nonlinear transport optimization claim.
