

VMEC/Boozer aggregate growth-vs-QL line search: passed

Comparison scope

status: passed
case: nfp4_QH_warm_start
reduction: mean
samples: 2
same samples: True
same direction: False
delta spread: $2e-08$
rel. reduction spread: 0.001706626597341806

Growth and QL proxy line searches are run with the same QH surfaces, field lines, ky samples, VMEC coefficient, and finite-difference controls. This compares reduced directions/results only; it does not validate nonlinear turbulent transport.
